Corrections and Emendations

Contributors have been invited to send corrections and emendations to be made in their papers, and the volumes have been scanned with some care. Corrections and emendations are as follows:

Volume 76

Page 1004, column 2, line 16 from top, *for* a few hundred cubic yards *read* a few hundred thousand cubic yards; line 18 from top, *for* required *read* are required

1091, Figure 4, triple point should be at approximately 6 mb and 0°C; ice-vapor boundary should run through points 1.0 mb, −20°C, and 0.12 mb, −40°C

1285, column 2, *for* δO^{13} read δO^{15}

1373, column 2, *for* orogeny *read* orogene

Volume 77

Page 277, Figure 4, caption should *read* Histograms of the mean orientation of elongate pebbles from proximal and distal slopes of the cross-valley moraines. N represents the number of samples, $\bar{x}$ the mean, and s the standard deviation. The midpoint represents a line drawn at right angles to the strike of the ridge crest. Because the bearing differs for each fabric site, the data are plotted as simply left or right of this line. The diagram illustrates that mean orientation is related to the short axial direction of the moraine, rather than to ice movement.

279, Figure 5, caption should *read* Histograms of orientation and dip strength from proximal and distal fabrics of the cross-valley moraines. N represents the number of samples, $\bar{x}$ the mean, and s the standard deviation. These parameters describe the sample distribution of orientation strength, although the skewed nature of the dip-strength samples should be noted.
